

Goal	Data Collected	Progress
This week, we plan on further developing our code. The code we have as of right now is ok, but it's not meeting the exact requirements needed for this project.	We went ahead to search online for other things students do to keep track of their requirements, and a lot of the videos were about using app reminders, magnetic whiteboard calendars, and such. Looking at their plans and our program made us see that we could make our program more unique to fit the liking of different students who may have different styles of keeping note.	Our code as of right is now decent. But there are more areas to improve it to make sure that the code wont crash from the simplest miss-inputs.
Strength	Areas for development	Strategy for success
Our code flows smoothly, and so far we have a good pre-code structure.	Our aim is to improve our code even more by debugging errors and making sure that all the possible features we will have on our code run smoothly.	Next week, we plan to complete the new ideas for extra features and try to at least clean up the code so it runs effortlessly.
